## **Stardust**

### **Student Worksheet ...**

- According to scientists, what parts of you are made of stardust?
- How were the first stars like “big ovens”..?
- How do scientists say our atoms got from the old stars, where they were made, to here, where they’re part of us..?

### **Something else to think about...**

If our bodies are really made of star dust, that means the atoms in your body are billions of years old. Your atoms drifted through outer space, wandering among the stars, before they got here and became part of you. How does that make you feel..?
